

In Search of Earnings Predictability

Zhi Da^{*}, Joey Engelberg[‡] and Pengjie Gao^{*}

^{*} University of Notre Dame

[‡] University of North Carolina – Chapel Hill

CARE Conference, April 10, 2010

Motivation

- Search queries reveal the intentions of those who query
- According to Choi and Varian (2009) "query data may be correlated with the current level of economic activity in given industries and thus may be helpful in predicting the subsequent data releases."
 - Provide evidence that search volume can predict subsequent reports of home sales, automotive sales and tourism.
- Firms announce earnings four times a year with a lag
- Search data may be well-suited to predict well-suited to predict lagged releases of firm fundamentals

Summary

- The search volume index (SVI) of a firm's most popular product is strongly related to the revenue announced by the firm
 - Increases (decreases) in SVI strongly predicts positive (negative) revenue surprises for the firm on its announcement day
- This predictability extends to the standardized unexpected earnings (SUE) of the firm
- We also find that SVI innovations predict earnings surprise relative to the consensus analyst forecast (SAFE),
 - especially among firms with high information uncertainty (high forecast dispersion)
- SVI changes predict announcement-window returns, *even after controlling for contemporaneous revenue and earnings surprises.*
 - Suggests information contained in SVI is value-relevant and incremental to other fundamental information about the firm.

Contribution

- Most non-GAAP leading indicators come *from the firm*
 - Linguistic content of firm announcements (Demers and Vega ,2009; Feldman et al, 2009; Li 2006; Li 2008)
 - Firm patents (Deng, et al., 1999; Hall et al., 2000; Gu and Lev, 2002, 2004)
 - Vocal affect (Mayew and Venkatachalam, 2009)
 - Order backlogs (Rajgopal et al. (2003a))
 - Same-store sales growth rates (Yang, 2007)
 - and others!
- Our leading indicator comes *from the customers*
 - Available in real-time
 - Fewer concerns about bias and selective disclosure
 - May be especially useful when firms have little information
- Closest to ours: Trueman et al. (2001) and Rajgopal et al. (2003b)
 - Which look at web traffic and profitability among Internet firms

Literature

- Others have recognized the advantages of using search volume
 - Da, Engelberg and Gao (2009) examine search volume for stock tickers (e.g., "MSFT" and "APPL") as a predictor of retail demand for shares
 - Ginsberg et al. (2008) found that search data for forty-five terms related to influenza predicted flu outbreaks one to two weeks before Centers for Disease Control and Prevention (CDC) reports

“Harnessing the collective intelligence of millions of users, Google web search logs can provide one of the most timely, broad-reaching influenza monitoring systems available today.”

What is Google's Search Volume Index (SVI)?

- Weekly volume of search for that term scaled by the time-series average

Searches Websites

Scale is based on the average worldwide traffic of **diet** in all years. [Learn more](#)

Search for Firm Products

- We gather data on firm products from Nielsen Media Research (NMR)
 - NMR provided to us a list of all firms which advertised a product on television during our time period of 2004 - 2008.
 - From this list of 9,764 unique firms, we hand-match the set of firms which are publicly traded - this results in a list of 865 firms
 - Unmatched firms are private firms (e.g., the Law Offices of James Sokolove; Empire Today and City Mattress) or non-profit organizations (e.g., Habitat for Humanity; the American Red Cross and the Public Broadcasting Service)
- These 865 firms are associated with 12,259 brand/products
 - Time Warner Inc. has 886 products in the database (magazines such as *People* to home videos such as seasons of *Friends* and the *West Wing*)
 - Lojack Inc. has one product – the Lojack Security system.
 - 337 firms which only advertise one product according to NMR

Search for Firm Products (cont'd)

- To make the data collection process manageable, we select each firm's most popular product according to NMR
- Next, we consider how these 865 products might be searched in Google
 - We do this by having two independent Ras report how they would search for each product
 - Where there are differences between the reports, we use Google Insights "related search" feature to determine which query is most common
- The resulting database is a list of firms and associated with search terms for its most popular product

Conclusion

- Find evidence that search volume predicts revenue and earnings surprises as well as announcement returns
- Suggests search volume is a value-relevant leading indicator of firm fundamentals
- Future work could identify key situations in which search volume may be most helpful (very little alternative information)
 - New product introductions
 - Example: The Nissan Leaf

Nissan Sales and Search Volume (FY '09)

	Sales (millions)	Relative Search
Versa	\$479.47	28.77%
Sentra	\$541.77	47.95%
Maxima	\$749.38	75.34%
Altima	\$2,410.70	100.00%
